ROLLING MILL

INTRODUCTORY

N presenting this book, which is devoted exclusively to ORNAMENTAL STEEL CEILINGS and SIDEWALLS, we wish in particular to call attention to a new feature in our construction, which the leading ceiling erectors of the country pronounce the best feature adopted in this line.

The one objectionable feature about some steel ceilings has been the mechanical construction, as the effect of a large number of artistic designs has been spoiled by open joints, which cannot be avoided with the construction of some of the ceilings on the market at the present time. We have always aimed to make construction first and design the second consideration in the manufacture of our ceilings. Therefore, we have always had the reputation of having the best constructed ceiling that is on the market. **To keep to the front we have gone one step farther than any of our competitors by repressing the Beads on Steel Upper and Steel Lower Dies, making them accurate to the one-thousandth of an inch and at the same operation, punching the nail holes in the plate at the nailing points, doing away with any nailing through the metal, a feature which we will guarantee to be a saving to the dealer of at least 20 per cent. in the cost of the erection of our ceilings, making it possible to have a perfect fitting ceiling in every respect at this reduced cost.**

With the increasing demand for our improved ceilings, we have just doubled our facilities in this department, therefore, are prepared to make prompt shipments and give the very best of service at all times. We solicit a share of your patronage and will do all in our power to show our appreciation.

THE CANTON ART METAL COMPANY
CANTON, OHIO, U. S. A.

CEILINGS AND SIDEWALLS

CEILINGS AND SIDEWALLS of metal have many advantages over wood and plaster as a covering and decoration; having long since passed the experimental stage, they are now considered of greatest value as a protection from fire and water. They do not crack, peel, or fall, their durability is conceded, and for decorating effects they admit of a high degree of ornamentation.

We call attention to the architectural features of the classified designs illustrated in this book. Each series has a full complement of parts, to make a complete design, which are interchangeable one with the other. The embossing of the plates is deep and the figure is clean and bold, special attention having been given to this part of the manufacture.

The system of making the dies on which these plates are stamped, produces a perfect bead, allowing no open joints. This gives a perfect alignment, true and regular, and makes the plates to fit on any of the four sides. There are no rough edges, as all sides are trimmed close to bead.

In ordering metal ceilings and sidewalls, always furnish a PLAN showing all projections, offsets, and openings, such as skylights, windows, doors, fireplaces, etc., with dimensions and location of each plainly marked on drawings. Always state which way the joists run in the room, and give distance from ceiling to the top of window casing. By furnishing the necessary information required with the order, it will enable us to ship promptly without further inquiry, avoiding unnecessary delay.

This illustrates a full-size section of our Panel Plate No. 4020, and gives a general idea of our improved construction, of "REPRESSED BEADS" and PUNCHED NAIL HOLES. All beads and nail holes in "CANTON" Ceilings are just as accurate as the beads and nail holes in above illustration, which makes "CANTON" Ceilings easier and cheaper than any other ceiling to erect.

State Armory, Buffalo, N. Y.

OUR SYSTEM OF PANEL CEILINGS

Is simple and requires no especially constructed "Starters," "Regulars," nor "Enders" to confuse and perplex the mechanics when applying the Panels, nor requires a large assortment of special plates to be kept in stock.

OUR SYSTEM OF FURRING STRIPS

FOR PANEL CEILINGS.

No. 1, Continuous Grooved Strip, 1x1 $\frac{3}{4}$ inches. No. 2, Cross Strip for 24-inch Panel. No. 3, Cross Strip for 18-inch Panel. No. 4, Cross Strip for 12-inch Panel. No. 5, Cross Strip for 6-inch Borders, or Mouldings. Fig. A shows section of Cross Strip placed in groove of continuous section.

Amount required per square, varies from 100 to 120 feet.

This furring is more simply and quickly applied than any other in use. The adjustable cross furring provides a solid backing at all nailing points. It is larger in size and correspondingly higher in price, but requires only about one-half as many lineal feet per square as continuous furring.

A special feature is that the cross strips require no nailing, and they can be placed in the proper position while the Panels are being put in place. See directions for erecting Panel Ceilings.

PROFILES OF CORNICES AND MOULDINGS.

PROFILES OF CORNICES AND MOULDINGS.

NOTE. BRACKETS ARE NOT USED EXCEPT WHERE SHOWN ON THIS SHEET.

DIRECTIONS FOR APPLYING OUR CONTINUOUS METAL CEILINGS

THESE DIRECTIONS MUST BE CAREFULLY READ AND FOLLOWED. BE SURE TO START RIGHT.

STRIKE A CHALK LINE at right angles to joists through the center of the room, or at distance from walls as designated on blue print; move the line one-half the width of wood strips either way desired, so as to line with edge of strip instead of center; strike lines parallel to this center every six inches, until the walls are reached. (For some plates the furring can be placed every 12 inches or even 24 inches, but cross furring will have to be provided under laps where nailing is required.) In order to get these measurements correctly, use a pole made from one of the furring strips and space off with marks six inches apart. *These measurements must be accurate.* Nail the furring strips to the joists with 2½-inch wire nails, keeping them on the proper side of chalk lines. Over plastering use 3-inch wire nails.

The strips near walls should be so placed as to allow cove cornice brackets to be readily nailed thereto. An additional strip should be placed to back the wood brackets in 6-inch moulding, where such brackets are used.

The plans should always be examined carefully before nailing on strips.

All borders having no beads on end lap must be cross-furred sufficiently at laps to admit proper nailing. Where border runs at right angles with wood strips, the laps will come on strips and no extra furring is needed. Other plates and fillers having no beads at end lap can be treated in the same way. Also provide furring where needed in cove cornices, at laps of filler part.

The brackets for mouldings, cove cornices, and foot moulds are placed at all joints of lapping. The moulding brackets are put in place after the ceiling plates are nailed in place, and measurements taken from the plates for location, or they may be nailed to moulding and put in place with it. *Where no brackets are shown on details none are required.* Mouldings and borders are made in 24 and 48-inch lengths, except for places where shorter pieces are needed, as shown on details. *Always use long pieces first and shorter ones to finish with.*

All irregularities in the joists or ceiling should be leveled before any plates or mouldings are put on. This may be done by furring down or by driving strips down to the level with wedges, or cutting away of joist as may be necessary. *On sheathing no wood strips are required. The sheathing must be level.*

Plates are 24x24 inches square and 24x48 inches (unless cut for special places in room, as generally designated on blue print detail) with place for nailing shown by marks in plates. These spacings are accurate and cannot be varied, the beads correctly interlocking each other. If carefully lapped, the beads will be straight and true, and will interchange with the mouldings, borders, etc. The laps will not be noticed, as they become a part of the ceiling pattern.

Nail the plates to the strip, using our oval head nails. Drive them through the prick marks provided in the plate. All plates, mouldings, and borders are stamped in multiples of six inches and are interchangeable. The figures in some of the plates alternate. *The plates must be placed on ceiling so that the figures will alternate correctly throughout the entire room.* A quarter turn of one plate against another will show the difference. Shifting the plate six inches past the other corrects the figures also in 6-inch designs. *Examine plates closely before erecting and see that they are placed properly.*

Commence in the center of the room over the first line struck, and work toward the side wall, being careful to start first plates in perfect line. The plates should be put on first, and space left open for the moulding. The foot mould and cove cornice are put up before the mouldings nearest the side wall, and enough margin must be left on the cove or filler to reach under the bead edge of moulding.

 All cove miters, foot mould miters, also ells, tees and crosses of mouldings, **that are not at right angles**, will have to be cut and fitted by party applying ceiling. Only such cornice blocks, corner leaves and miters as are shown and named in the catalogue are furnished.

Place corner leaves over all cove miters where practicable. Care should be exercised to have them neatly fitted.

By working from a line stretched across ceiling over the strip running through center of the plate you are putting on, you can get a perfect alignment throughout the room.

Always be careful in measurements, and accurate at starting, and the result will be satisfactory.

Examine Details Carefully.
